

# | Build it Right the First Time

## ***Documentation That Keeps Pace With the Pour***

Concrete crews work against tight timelines. Pre-pour inspections, rebar checks, pump logs, and test results all need to be verified before work can continue. When paperwork goes missing or arrives late, placements stall and costs rise.

Corfix keeps inspections, reports, and supporting documents organized in real time so crews can stay focused on production.

## ***Pre-Pour and Formwork Checks in One Place***

Workers and site supers can complete and verify pre-pour inspections, formwork verification, rebar spacing checks, and embed confirmations from their phone. Every submission is time-stamped and stored so nothing slows the pour.

## ***Pump Logs and Inventory Without the Paper Chase***

Crews can photograph and upload receipt and use of concrete, batch slips, and slump results directly into their pour documentation or daily reports. Records stay linked to the correct placement, which helps support QA, testing, and future questions.

## ***Postpour Documentation That Stays Organized***

Crews can record curing details, protection measures, environmental and temperature readings, and finishing notes, directly from the field. Forms stay tied to the correct project placement, so supervisors have a complete record if questions arise later.

## ***Safety Documentation That Sticks***

Hot and cold weather concrete procedures, equipment pre-use inspections, and daily hazard assessments all stay in one system. Supervisors can pull records instantly during audits.

## ***Certification Tracking That Matches Site Needs***

Hot and cold weather concrete procedures, equipment pre-use inspections, and daily hazard assessments all stay in one system. Supervisors can pull records instantly during audits.

## ***Timekeeping Tied to Daily Compliance***

Crews can't clock out until their pre-pour and post-pour forms are complete. This keeps documentation accurate and supports clean end-of-day reporting.

## What You Get With Corfix

---

- Pre-pour, formwork, and rebar inspection forms completed from the field
- Photo uploads for delivery tickets, batch slips, and slump records
- Test results stored and connected to each placement
- Hot and cold weather procedures accessible on site
- Automated tracking of ACI, WHMIS, fall protection, and lift certifications
- Dashboards that show documentation status across all placements
- Offline access for deep pours, parkades, and remote work areas
- Timekeeping linked to documentation for full accountability
